

Latent perturbation → influence map

(1) latent $z \in \mathbb{R}^{20}$

top-k variance-ranked dims

$$z'_d = z \pm \varepsilon \cdot \sigma_d \cdot e_d$$

(2) per-dim sensitivity $|\Delta \hat{X}(\lambda_{ex}, \lambda_{em})|$

(3) aggregated influence → MMR

(1) perturb top-k dims → (2) measure $|\Delta \hat{X}|$ per $(\lambda_{ex}, \lambda_{em})$ → (3) aggregate → MMR

White circles in panel (3) mark the K bands MMR ultimately selects.
